

Economic Globalization and Governance: The Role of Social Globalization

Nabamita Dutta and Deepraj Mukherjee

Recent decades have experienced a marked acceleration in the process of globalization. This remarkable proliferation of the globalization phenomenon has been associated with significant consequences felt in economic, social and political well-being around the globe. This paper analyzes the role of economic globalization in improving different governance issues that are of particularly important in the context of developing nations. We contribute to this literature by exploring how does economic globalization comprising of different aspects of internationalization like trade openness, FDI inflows, and portfolio investments affect different dimensions of governance? Further, while a large part of globalization implies greater trade and FDI inflows, it also implies integration of culture, ideas and vision. In this context, we delve into the role of a different aspect of globalization where emergence of neo transnational capital played a pivotal role in changing different and varied social mindsets across the world into a more cosmopolitan one (social globalization). In particular we analyze if social globalization acts as a moderator in the relationship between economic globalization and governance. Our contributions in the paper are twofold. First our results show that economic globalization enhances most indicators of governance like rule of law, government effectiveness, reducing corruption, regulatory quality and voice and accountability. Second, our results importantly show that indeed social globalization acts as a moderator. The estimated marginal impacts show that countries with low levels of social globalization, fail to benefit from economic globalization. Yet, this impact is enhanced for countries with higher levels of social globalization.

I. Introduction

Good governance and political stability are the prior condition to establishing a favorable business environment (Klapper et al., 2009). In an uncertain environment characterized by unclear property rights, constant policy surprises and policy reversals, uncertain contract enforcement, and high corruption, entrepreneurs are reluctant to commit resources. This reaction of the private sector would translate into lower aggregate investment and distorts the allocation of resources and reduces economic growth (Brunetti, Kisunko, & Weder 1998). Busse and Hefeker (2007) state that changes in government policy and/or political institutions can affect entrepreneurial behavior, as the risk premium incorporated in any investment project is influenced by political risk. Fogel, Hawk, Morck, & Yeung (2006) argue that rules, regulations, and property rights and their enforcement facilitate entrepreneurship because they affect transactional trust among business parties. In other words, weak property rights protection, corruption, and an inefficient judicial system can impede information flow, raise information costs, and erode the gains from information and as a result hinder entrepreneurial activity. The leading organizations like the World Bank and the IMF are paying increasing attention to the need for a global governance and have started placing greater thoughts on how globalization may be playing a critical role in this context. This paper aims to contribute to the literature by looking empirically into the question – how can globalization affect different governance indicators?

A few studies have looked into this topic and have mostly focused on how globalization affects corruption levels of a nation, a critical element of governance. Yet, other than corruption other forms of governance like voice and accountability, rule of law and regulatory quality should be affected by globalization. For example research by Devesh et. al. (2010) states that since the process of liberalization began in India, the dalits labeled as one of the inferior castes of India have been able to participate more in the business climate. The DICCI (Dalit Indian Chambers of Commerce and Industry) has about 3000 members nationwide and they are very successful in the new globalized business world. Dalits, who are considered the inferior caste in the Indian society, could succeed in the new business climate brought in by globalization that is caste neutral in origin. This, in turn, can enable them to possess greater voice and accountability. Further, in a globalized nation, norms are ruled relatively more by the market and the government has to make itself transparent and accountable to both individuals and business. Thus, it has the responsibility to implement sound policies and make itself independent from

political pressure. Thus, government effectiveness should rise. For example, the establishment of the World Trade Organization (WTO) in 1995 was an important step in the process of global liberalization. Along with providing incentives for countries to trade more with each other, one of the major functions of the WTO is to cooperate with the World Bank and the IMF to achieve greater coherence in economic policymaking. Thus, individual nations have to abide by such rules that in turn, will transform their state of governance. Further, greater membership in international treaties makes a country go through a transformation in its governance structure as well.

Apart from government effectiveness, government under the pressure of foreign completion needs to be more receptive to the needs of private sector development. Yet, it can negatively affect regulatory quality if the government caters to promote policies that help the development of certain big business and ignore the benefit of the other small business. The degree of political globalization is measured by, the number of embassies in a country, the number of international organizations to which the country is a member, the number of UN peace missions a country participated, and by the number of international treaties the country is in.

Some others forms of governance might actually be degraded due to greater globalization. Globalization leads to unequal distribution of income because of the relative differences in mobility of labor and capital. According to economic theory, labor is relatively less mobile than capital since workers find it difficult to move across borders but investors can move the capital quickly across borders to evade regulatory or tax regimes. Thus, there might be discrepancies in the income gains between the capitalist and the labor group post globalization that can lead to social inequality. This in turn might lead to mass grievance and, thus, mass uprising. Thus, globalization might actually lead to higher political instability.

This paper investigates the impact of globalization in its different forms of various governance indicators. We contribute to the literature by not only focusing on corruption but other key elements of governance. Further, other than considering standard measures of globalization like trade openness and FDI inflows, we consider different measures that distinguish between political and economic globalization. Our contribution to the literature is three fold. We contribute to the relatively inadequate association of globalization on governance. We focus on multiple aspects of governance rather than focusing only on corruption. Our research helps us to answer the question how globalization may affect the various indicators of

governance differently. We incorporate different notions of globalization – be it in the form of greater trade or membership in international organization or greater internet penetration. Second, we consider measure of governance that captures perceptions in the society from all players. Thus, the measures capture the perceptions of the government, the business and the citizens. This is important as globalization affects everyone in a society and the benefits and/or costs of globalization should be borne by all the players in the society. Thus, our empirical research captures whether globalization, in any form, affects all players in a society equally rather than focusing only on some beneficiaries like the firms. Third, our research has important implication in terms of policy implications. Based on our empirical results, it will help us to understand how globalization may affect the state of governance in a nation. Thus, according host country governments may need to reshape the implications so as to reap the benefits or avoid the damage caused by globalization in terms of its impact on governance.

Section II talks about the extant, Section III describes data to be used in the paper, Section IV presents some plots from the raw data and Section V briefly talks about the empirical methodology to be used in the paper.

II. Research Background and Hypotheses

“Globalization” is a loosely used signifier that invoked intellectual curiosity in the recent economic and political discourse. Before proceeding further, this paper will make an attempt to provide some definitional clarity of this used measure. The predominant version of globalization associates it with the profound restructuring of world capitalism that began in the 1970s. However, we possess a view that globalization is not a new process, but the near culmination of the centuries-long process of the spread of capitalist production relations around the world and its displacement of all other economic systems by the end of 20th century. The capitalist system since its inception has been expanding in two directions, extensively and intensively. The final phase in capitalism's extensive enlargement started with the wave of colonization of the late nineteenth and early twentieth century and concluded in the 1990s with the reincorporation of the former communist regimes in the aftermath of the collapse of Soviet Union. Under globalization, the system is undergoing a dramatic intensive expansion. Capitalist production relations are replacing what remains of all relations around the globe. The era of the primitive accumulation of capital is coming to an end. In this process, those cultural and political institutions that fettered

capitalism are swept aside, paving the way towards the “unification” of social life worldwide. This “unification” implies a path for the global community that converges in a cultural commonality.

In our paper we explore three facets of globalization: Economic, Political, and Social. The idea of economic globalization has been well researched. Capital has achieved a newfound global mobility and its reorganizing production worldwide in accordance with the whole gamut of political and factor cost considerations. This involves the worldwide decentralization of production together with the centralization of command and control of the global economy in transnational capital. Globalization is unifying the world into a single mode of production and a single global system and bringing about the organic integration of different countries and regions into a global economy. The relationship between economic globalization and governance is bi-directional in nature.

Economic globalization, be it in the form of FDI inflows to a nation, extent of trade openness or capital openness of a nation. Using principal component analysis for 13 risk factors like bureaucratic red tape, corruption, political instability and so on, Wheeler and Mody (1992) found no effect of such institutions for U.S. manufacturing FDI. Other studies like Brunetti and Weder (1998) find a negative correlation between institutional uncertainty and private investment. Wei (2000) stresses that higher corruption level for a country has negative impact on FDI inflows for a nation. Several studies have established the importance of democratic institutions in the context of FDI inflows (see, for example Busse, 2004; Jensen, 2003; Harms and Ursprung, 2002). On the other hand, Li and Resnick (2004) find that democracy boosts FDI via indirect channel, the channel of property rights protection. The most pioneering in the context of the role of institutions on globalization has been by North (1991). North stresses that institutions, defined as constraints that shape human actions, critically affect the decision to invest in an economy. Presence of inefficient institutions, lack of well-defined property rights and the non-existence of enforceable contracts leads to bad investment decisions and are not favorable for the globalization process.

But, can economic globalization affect institutional structure in a country? With greater globalization, we can expect that along with income and economic development, a country’s institutions should undergo significant transformation. Most empirical and theoretical studies have emphasized the role of institutions in attracting greater globalization in the form of trade openness, FDI inflows or capital account liberalization. The reverse causation channel of the

impact of globalization on governance has been relatively less explored. For example, Kwok and Tadesse (2006) show that MNCs in nations may lower corruption for the host country via the regulatory pressure effect, the demonstration effect and the professionalization effect. The behavior of the MNC in a host country is constrained by the regulatory behaviors of the home country as well as the international business community. A few studies have investigated the impact of trade openness on corruption. The pioneer work in this regard is that of Krueger (1974) who, based on a theoretical model, shows that greater trade restrictions caters to the generation of greater rent and, thus, higher corruption. Bhagwati and Srinivasan (1980) show how corruption can thrive more in countries with higher tariffs, due to the attempts by special interest groups to expropriate tariff revenues. In terms of empirical papers, Ades and Di Tella (1999) show that economies engaging in lower global competition, experience higher levels of corruption. This context leads us to test our first hypothesis:

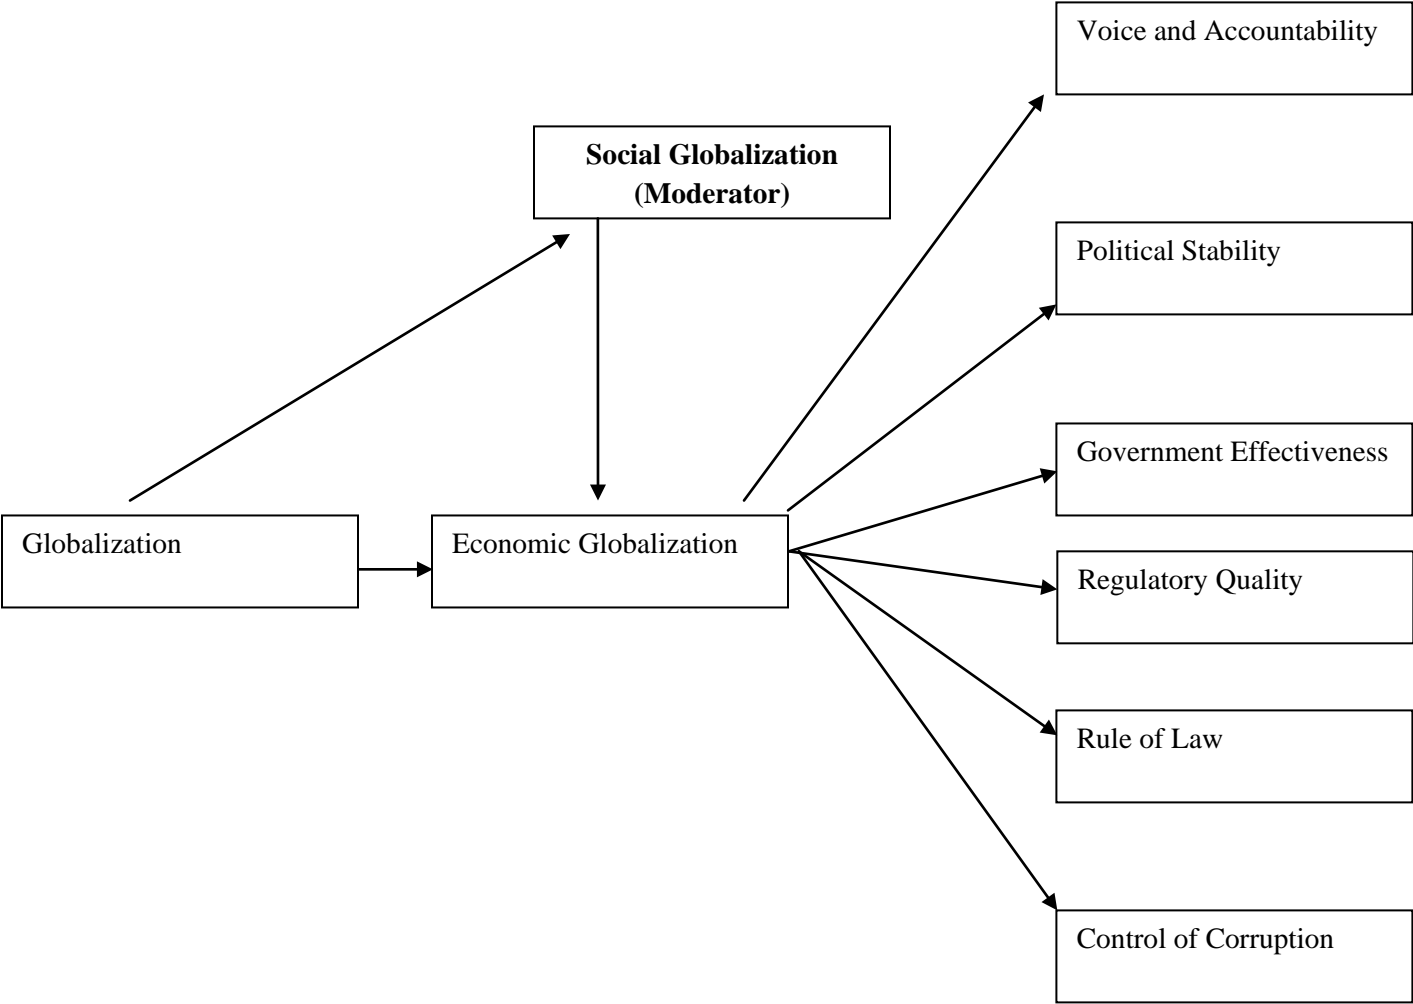

Hypothesis 1: Economic Globalization results in better governance of the host country.

To our knowledge, the implication of social globalization has not been previously analysed, although it may offer interesting implications. The role of social globalization acts as a moderator to economic globalization. The emergence of neo transnational capital played a pivotal role in changing different and varied social mindsets across the world into a more cosmopolitan one. In recent decades such ideological current has gained prominence and it complements economic globalization. The term like “Liberal internationalism”, are used to eloquently describe this mindset which believes in a single human race, peacefully united by free trade and common legal norms, and run by states that advocate civic liberties and representative institutions. Such liberal internationalism aimed at creating a global order of a sort of political and economic union with a code of conduct among states within the Westphalian system, i.e., states have jurisdiction in their own territories. Liberal cosmopolitanism aims at creating a global order that governs important political and economic aspects of internal and external behavior of states. It does not advocate world government to decide on vital international issues. Rather, it proposes a set of disciplinary regimes, i.e., global governance, that penetrate deep into the economic, social, and political life of nation-states, and safeguards international flows of trade and finance. In that the state prosperity through trade and finance is binded by this global

community and is conditional, which can be withdrawn if a state fails to meet the domestic or foreign standards of behavior set by the requirements of liberal governance. Hence, economic globalization through transnational flow of capital and labor is further boosted and gains strength by this changing social fabric in the participatory societies. Such integration of societies across the globe constructs the idea of social globalization and in turn should act as a moderator in enhancing the role of economic globalization on improving the country level governance issues. Consequently, we get our hypothesis as stated below:

Hypothesis 2: The role of economic globalization in improving different governance indicators is enhanced by the formation of “international community” captured through social globalization.

Role of Globalization on Governance

All positive relationships

III. Data Description

Our main measure of governance comes from Worldwide Governance Indicators (WGI-2013,2007) prepared by Kaufmann, Kraay and Mastruzzi. As defined by them, governance captures the institutions and traditions based on which authority is exercised in a country. This includes various important aspects of a good governance – accountability, transparency and inclusiveness. It has been used both in World Bank publications to identify and describe governance trends around the world (e.g., World Bank 2007) and in scholarly journal articles to test major theoretical propositions such as the relationship between governance and growth (e.g., Kaufmann and Kraay 2002; Kaufmann et al. 2007a; Kurtz and Schrank 2007a, 2007b). It is also regularly cited in policy discussions and debates, especially with reference to foreign aid. The Millennium Challenge Corporation, for instance, employs one of the most explicit frameworks for identifying countries that qualify for its assistance using WGI measures.

The Worldwide Governance Indicators report on six broad dimensions of governance for 215 countries over the period 1996-2013: The six measures of governance indicators are voice and accountability, rule of law, regulatory quality, political stability and absence of violence, government effectiveness and control of corruption. These indicators encompass the views of a large number of enterprises, citizens and expert survey respondents in industrial and developing countries. The WGI uses different types of source data including surveys of households and firms, commercial business information providers, non-governmental organizations, and public sector organizations .

One of the first indicators, voice and accountability, is based on the ‘perceptions of the extent to which a country's citizens are able to participate in selecting their government, as well as freedom of expression, freedom of association, and a free media’(WGI, 2013). Perceptions about the quality of public services and civil services and the extent of their independence from political pressures, is captured in government effectiveness. It also includes perception about the quality of policy formulation and implementation and the credibility of government to be able to commit to such policies. Regulatory quality is linked with government effectiveness in the sense

that it takes into account the perceptions about the ability of the government to ‘formulate and implement sound policies and regulations that permit and promote private sector development’ (WGI, 2013). Rule of law assesses the perceptions of the citizens in a society about law and order. Thus, it includes factors like the quality of contract enforcement, property rights, the police and the courts as well as the likelihood of crimes and violence. The prevalence of perceptions of the likelihood of the government being overthrown is assessed by the political stability and absence of violence indicator. Finally, control of corruption assesses perceptions of corruption, conventionally defined as the exercise of public power for private gain.

As a measure for globalization, we consider the KOF index of globalization (Dreher, 2006; Dreher et al, 2008). The KOF index is developed on the basis of 23 variables. These variables cover several elements of globalization, ranging from intensity and restriction of economic flows to number and typology of personal contacts and to political engagement among countries. The whole set of variables are then summarized into three sub-indices, i.e. economic, political and social globalization index, and an overall index of globalization.

For the purpose of this paper we use the first two dimension so of globalization index i.e. the economic and social globalization. Broadly speaking, economic globalization has two dimensions. First, actual economic flows are usually taken to be measures of globalization. Second, the previous literature employs proxies for restrictions to trade and capital. Consequently, two indices are constructed that include individual components suggested as proxies for globalization in the previous literature.

The KOF index classifies social globalization in three categories. The first covers personal contacts, the second includes data on information flows and the third measures cultural proximity. Finally, the overall KOF index of globalization (KOF) is obtained by a weighting procedure of the sub indexes according to the technique of the principal components analysis. These indexes range from 0 to 100, where higher values denotes higher degree of globalization.

IV. Empirical Methodology

Our empirical analysis is aimed at exploring the following questions

- a) How does economic globalization affect the different dimensions of governance?

b) Is the effect of economic globalization on governance traits conditional of social globalization?

In order to answer (a), we estimate the following reduced form model

$$\text{Govern}_{it} = \beta_0 + \beta_1 \text{Govern}_{it-1} + \beta_2 \text{Eco Glob}_{it} + \sum_{j=1}^J \alpha_j X_{jit} + \beta_2 \gamma_i + \beta_3 \theta_t + \epsilon_{it} \quad (1)$$

where Govern_{it} is the measure of governance considered for country i in time t . Govern_{it-1} is the measure of governance lagged one period. It captures the persistence of the dependent variable and, thus, enables us to estimate a linear dynamic panel-data (DPD) model. Eco Glob_{it} is the measure of globalization for country i in time t . X_{jit} is the matrix of control variables, γ_i is the country fixed effect, θ_t is the time specific effect and ϵ_{it} is the random error term. We estimate equation (1) employing a fixed effect model. In order to make sure that our estimates of the coefficients of interest are only capturing the variation within countries over time, it is important to use country fixed effect which control for the time invariant specific factors like legal origin, colonial origin, extent of ethnic diversity and so on. For the fixed effect estimates, we control for endogeneity concerns to some extent by considering lagged globalization (Glob_{it-1}). As described below, we also use GMM¹ estimation to address endogeneity and omitted variable concerns.

In order to address (b), we estimate the following model by introducing interaction term of the two dimensions of globalization – economic and social.

¹ Employing Instrumental Variable (IV) Strategy and, thus, using two-stage least squares (2SLS) estimates is yet another way to handle endogeneity and omitted variable bias concerns. As pointed out by Persson and Tabellini (2006), it is a daunting task to find strictly exogenous instruments for regressions with country fixed effects. Dynamic panel estimators solve this problem since they allow us to address the endogeneity issues by not having to find strictly exogenous instruments. Such estimators have become popular for recent empirical panel studies [see, for instance, Dutta, Leeson and Williamson (2013); Asiedu and Lien (2011); Asiedu, Jin and Nandwa (2009); Djankov, Montalvo, and Reynal-Querol (2006); Acemoglu, Johnson, Robinson, and Yared (2008) to mention a few]

$$\text{Govern}_{it} = \beta_0 + \beta_1 \text{Govern}_{it-1} + \beta_2 \text{Eco Glob}_{it} + \beta_3 \text{Soc Glob}_{it} + \beta_4 (\text{Eco Glob} * \text{Soc Glob})_{it} + \sum_{j=1}^J \alpha_j X_{jit} + \beta_5 \gamma_i + \beta_6 \theta_t + \epsilon_{it} \quad (1)$$

β_4 captures the interactive effect of economic globalization and social globalization on governance. We are interested in exploring how different levels of social globalization affect the impact of economic globalization on governance. For this we need to estimate the overall impact of economic globalization on governance. The point estimate for this is given by $\frac{\delta \text{Govern}_{it}}{\delta \text{Eco Glob}_{it}} = \beta_2 + \beta_4 \text{Soc Glob}_{it}$. Thus, we are interested in the sign and magnitude of β_2 and β_4 . β_2 captures the direct effect of economic globalization on governance while β_4 captures the indirect effect of the same through social globalization. Based on whether both β_2 and β_4 are $>$, $=$ or $<$ 0, as well as the magnitude of Soc Glob_{it} , $\frac{\delta \text{Govern}_{it}}{\delta \text{Eco Glob}_{it}}$ will be $>$, $=$ or $<$ 0.

We estimate equation (2) using System GMM estimators. Due to the presence of unobserved panel-level effects that are correlated with the lagged dependent variable, DPD models suffer from inconsistent estimators (see, Asiedu et. al., 2009). Arellano and Bond (1991), in this context, suggested the use of General Method of Moments (GMM)² estimators that take care of the inconsistency. The Difference GMM estimator, proposed by Arellano and Bond, takes care of endogeneity and omitted variable bias concerns by employing lagged levels of the first differences of the endogenous variables as instruments. An improved³ estimator, known as the System GMM estimator and suggested by Blundell and Bond (1998), uses additional moment conditions to obtain a system of two equations – one in difference and one in level. The use of the extra moment conditions ‘that that ‘rely on certain stationarity conditions of

² According to Roodman (2009), GMM dynamic panel estimators are apt to handle small “T” (fewer time periods) and large “N” (many individual or country) panels subject to country fixed effects, a linear functional relationship that is dynamic in nature, independent variables that are not strictly exogenous and are correlated with present as well as past realizations of the error term and presence of heteroskedasticity and autocorrelation within countries.

³ Arellano and Bover (1995) suggested that lagged levels are often poor instruments in the case of Difference GMM estimators.

the initial observation' result in reduced and greater precision over Difference GMM estimates. Thus, we use System GMM estimators as our benchmark estimator.

The next section elaborates on our empirical results. As mentioned above, we use fixed effect specifications with two way fixed effects as a starting point of our analysis. Subsequently, we move to the System GMM estimators. Our panel consists of an extensive set of countries over the period 1996 to 2012. Since the governance indicators do not go back beyond 1996, we are unable to check our results with a panel that dates back further. Yet, the large number of countries and a time period over 16 years provides us with sufficient data points as well as a decent time length.

1. Benchmark Results

a. Fixed Effect Estimates

In Table 3, we present the results for equation (1) estimates. We consider GDP per capita and polity as our benchmark controls. In the subsequent tables, we add more controls. The different columns present the different indicators for governance. We should mention here that over the sample period 1996 to 2002, every other year is considered in the sample to be at par with the dependent variable. As we mentioned in the data section, over this sample period, governance data is available for every other year and then the data is available annually from 2002 onwards. Our panel is constructed accordingly.

As we can see from the results, governance lagged one period has a positive and significant impact for all the different indicators. The coefficient of our variable of interest, economic globalization, is positive and significant for all indicators of governance except political stability. Thus, our initial results point to a significant positive impact of economic

globalization on governance. We consider economic globalization along with all controls in lagged form which minimizes endogeneity concern to some extent. In terms of economic significance, for example, a standard deviation rise in economic globalization will raise control of corruption score by 0.04 percentage points which, based on the variable range, amounts approximately to 1% rise in the score. The impact is similar for government effectiveness, regulatory quality or voice and accountability. It is smaller in the case of rule of law. GDP per capita considered in logarithm form and lagged one period, has a positive impact on government effectiveness, political stability, regulatory quality and rule of law. The impact of democracy is also positive and significant for most of the indicators.

b. System GMM Estimates

Our System GMM estimates are presented in Table 4 where we provide the estimation results for equation (2). One thing to note here is the construction of the panel used for the System GMM estimates. We follow Acemoglu, Naidu, Restrepo and Robinson (2014) in this regard. We focus on a four year panel where we consider an observation⁴ every 4 years. As the authors note, creating such a panel is better than panels based on averages since the latter would bias the estimates by resulting in a complex pattern of serial correlation. We use the same set of benchmark controls as Table 3 along with adding social globalization and the interaction term. For our estimations, economic globalization, social globalization, the interaction and GDP per capita are treated as endogenous. As we see from the table, lagged governance, as expected, positively affects present governance levels. The coefficient of our interaction term, Eco Glob * Soc Glob, is positive and significant in case of control of corruption, governance effectiveness, regulatory quality and voice and accountability. Thus, the coefficient of the interaction term

⁴ It is worth mentioning in this regard that for the governance indicators, we have data every other year over the period 1996 to 2002. Therefore, the variables are available for 1996, 1998, 2000 and 2002.

suggests that with social globalization, the impact of economic globalization on governance is enhanced. Yet, unless we estimate $\frac{\delta \text{ Govern}_{it}}{\delta \text{ Eco Glob}_{it}}$ for different levels of social globalization, we cannot say anything about the overall impact of globalization on governance. We estimate the marginal impacts in Table 6A. In terms of the controls, polity has a positive and significant impact on control of corruption and voice and accountability.

In Table 5, we include additional controls – urban population as a percentage of total population and logarithm of secondary school enrollment. The interaction term, Eco Glob * Soc Glob, is positive and significant in the case of control of corruption, government effectiveness, regulatory quality and voice and accountability. The direct impact of globalization is negative and sometimes significant. The negative impact does not mean much in the presence of the interaction term. The only scenario in which the negative coefficients of economic globalization for the different specifications will be meaningful, is when social globalization = 0. For our sample, social globalization score ≥ 0 . As mentioned above, the overall impact of economic globalization can be analyzed by estimating the marginal impacts.

In table 6A, we report the marginal estimates of economic globalization on the different governance indicators for different levels of social globalization. We follow the methodology employed by Asiedu, Jin and Nandwa (2009) and Asiedu and Lien (2011) and then used in subsequent papers (see, Dutta, Cooray and Mallick, 2014) . The estimates $\widehat{\beta}_2$ and $\widehat{\beta}_4$ are obtained from Table 5. Based on the means for $\widehat{\text{Soc Glob}}$, we estimate $\frac{\delta \text{ Govern}_{it}}{\delta \text{ Eco Glob}_{it}}$ at the 10th, 25th, 50th, 75th, 90th and 95th percentiles⁵ as well as the mean of social globalization. We provide country names corresponding to each of the percentiles that helps us to put the coefficient

⁵ The percentiles as well as the mean are based on the means of social globalization for all the countries in the sample.

estimates into perspective. For example, as evident from Table 5, Sudan lies at the 10th percentile indicating it's a country in the lowest level of social globalization. Comoros belongs to the next group of countries in terms of social globalization, thus, lies at the 25th percentile. Countries like Luxembourg and Sweden are in the top 90 and 95 percent of the sample respectively. The marginal estimates show that with higher levels of social globalization, the impact of economic globalization on governance indicators is enhanced. When countries suffer from low levels of social globalization, improvement in economic globalizations fails to improve governance. In fact, in some case like control of corruption and voice and accountability, governance might actually be worsened. Based on the marginal estimates, countries need to improve their social globalization beyond the median level (based on our sample median) to be able to derive benefit from improvements in economic globalization. This is, further, reinforced from Table 6B. In Table 6B, we present the tipping points for social globalization. The critical level of social globalization, $Soc\ Glob^* = -\frac{\hat{\beta}_1}{\hat{\beta}_2}$, the impact of economic globalization on governance is zero.

When $Soc\ Glob > Soc\ Glob^*$, then $\frac{\delta\ Govern_{it}}{\delta\ Eco\ Glob_{it}} > 0$. In general, we find that to have a positive and significant impact of economic globalization, countries need to be at the median or a higher level of social globalization.

V. Robustness Analysis

We perform several robustness tests to ensure the validity of our results. We start by checking our results with the sub-components of social globalization. As mentioned earlier, social globalization consist of personal contact, information flows and cultural proximity. The idea is to check whether the different sub-dimensions of social globalization affect the impact of economic globalization on governance in a significant manner or not. While personal contact captures

personal information among people from different parts of the world in a country, information flow captures the flow of ideas and images. Cultural proximity measures “the domination of U.S. cultural products” (Dreher, 2006). The results for each of these sub-groups are presented in Table 7. We present the results for which the coefficient of the interaction term is significant. Columns (1) to (5) consider cultural proximity as the sub-component of social globalization. The results for the other two – information flows and personal contact – are presented in columns (6) to (8) and columns (9) to (11) respectively. Cultural proximity seems to be affecting the maximum number of governance dimensions. Government Effectiveness, Regulatory Quality and Voice and Accountability⁶ are affected by all aspects of social globalization.

VI. Conclusion

We have asked how economic globalization can overcome the country level governance dilemma. Examining a sample of 215 countries covering from 1996-2013, we find robust empirical support for the fact that economic globalization do indeed helps in improving a country’s governance measures. Our results further show that social globalization i.e. global convergence towards a set of norms and values do act as a moderator in this relationship. The estimated marginal impacts show that countries with low levels of social globalization, fail to benefit from economic globalization. Yet, this impact is enhanced for countries with higher levels of social globalization.

The measure of economic globalization used in this study is highly significant in most specifications and has been shown to be quite robust to the inclusion of potentially relevant covariates in the regression as well as different estimation methods. The results supports that, the absence of restrictions on trade and capital, and culture convergence through many pervasive

⁶ In the case of information flows, the p value for the interaction term *Eco * Inf.Flows* is 0.10

pores of globalization, improve governance. Countries like Rwanda or Zimbabwe are insulated themselves from the world economy. Hence, there isn't any surprise to see those having poor institutions leading to lack of governance which repress growth and fails to eradicate poverty.

Table 6A: Marginal Impact of Economic Globalization on Governance Indicators at different levels of Social Globalization

$\frac{\delta Gov_{it}}{\delta Eco Glob_{it}} = \hat{\beta}_1 + \hat{\beta}_2 * Soc Glob$, evaluated at various values of internet users. $\hat{\beta}_1$ and $\hat{\beta}_2$ correspond to estimates from Table 5.

Value of Soc Glob	Perce ntile $\widehat{Soc Glo}$	Corresponding Country	Control of Corruption	Governme nt Effectiveness	Political Stability	Regulato ry Quality	Voice & Account.	Rule of Law

Note1: These marginal impacts have been estimated based on the estimates from Table 5.

Note2: Standard errors in parentheses;*** p<0.01, ** p<0.05, * p<0.1

Table 6B: The Tipping Points - The critical level of Social Globalization

Setting $\frac{\delta Gov_{it}}{\delta Eco Glob_{it}} = 0$, we have $\hat{\beta}_1 + \hat{\beta}_2 * Soc Glob = 0$.

Thus, $Soc Glob^* = -\frac{\hat{\beta}_1}{\hat{\beta}_2}$. $Soc Glob^*$ is the threshold income level.

Dependent Variable	$Soc Glob^*$	$\frac{\delta Gov_{it}}{\delta Eco Glob_{it}}$ for $Soc Glob > Soc Glob^*$
Control of Corruption	40	positive
Government Effectiveness	50	positive
Political Stability	---	Always positive
Regulatory Quality	32	positive
Voice and Accountability	54	positive
Rule of Law	2.3	positive
